

**Metals**

Metals come from ores in the ground. **Stock forms** are sheets, bars and rods

Ferrous Metals contain iron and are magnetic and rust		
Material	Key info	Examples
<b>Low Carbon Steel</b>	Tough and ductile and easily machined and welded	Construction, screws, cars
<b>High Carbon Steel</b>	Hard and wears well	Tools, blades and knives
<b>Cast Iron</b>	Hard but brittle. Easily cast but hard to machine	Pots, pans, vices

Non-Ferrous Metals do not contain iron, aren't magnetic and don't rust		
Material	Key info	Examples
<b>Aluminium</b>	Light, high strength to weight ratio and ductile	Pots, pans, cars, cans
<b>Copper</b>	Ductile, malleable and good conductor	Plumbing supplies and cables
<b>Tin</b>	Soft, malleable and good conductor	Used as a protective coating

**Alloys**

**Alloys** are mixtures of 2 or more metals to get the best of their properties

Material	Key info	Examples
<b>Brass</b>	Malleable and easy to cast	Musical instruments, plumbing
<b>Stainless Steel</b>	Doesn't rust, hard and smooth	Cutlery, medical tools, etc

**Plastics**

Plastics come from crude oil. **Stock forms** are sheets, powders, granules and rods

Thermoplastics can be reheated and reshaped and infinite amount of times		
Material	Key info	Examples
<b>PET</b>	Easily <b>blow moulded</b> , food safe and easily recycled	Bottles, packaging, etc
<b>PVC</b>	Flexible, tough, easily <b>extruded</b>	Pipes, tape, hard hats
<b>HIPS</b>	Flexible, lightweight, food safe and easily <b>vacuum formed</b>	Containers and yoghurt pots
<b>Acrylic</b>	Tough, brittle, easily scratched	Car lights, baths, displays/ signs

Thermosets once heated and set <b>cannot</b> be reshaped		
Material	Key info	Examples
<b>Melamine Formaldehyde</b>	Food safe, hygienic, hard and brittle	Kitchenware and work surfaces
<b>Urea Formaldehyde</b>	Good insulator, hard and brittle	Electrical casings, buttons and handles
<b>Polyester Resin</b>	Strong, heat resistant, can be transparent	Coatings, casings

**Primary Processing of Metals and Alloys**

Metals are mined from the earth and then go through an extraction process. Extraction happens by putting the ore in a blast furnace. The metal is then separated from the waste material.

**Primary Processing of Plastics**

Crude oil is extracted from the earth and then processes into different types of fuels, etc. This is called **Fractional Distillation**. A process called **Cracking** then converts the large hydrocarbon molecules into plastics.

### Design Briefs

A Design Brief is the statement of how you will solve the Design Problem  
It will often include:

- Constraints/ limitations
- What the product is
- Materials/processes
- Any key information you know

### Design Specifications

A Design Specification is a list of requirements your product has to meet in order to be successful

It is also useful for evaluation. If your product hasn't met the Spec then it gives you a starting point for improvements.

<b>Aesthetics</b>	What the product looks like? Style? Colour Scheme? Design Movement?
<b>Customer</b>	Who would buy it? (Age, gender, socio-economic, personality) How does the design appeal to them?
<b>Cost</b>	How much will it cost? (min-max) Why?
<b>Environment</b>	Where will it be used? Why? How will you make it suitable?
<b>Safety</b>	How is it safe? How will it be checked? Why must it be safe?
<b>Size</b>	What is the maximum or minimum size? Why?
<b>Function</b>	What does the product do? What features make it do that function well? How is it unique from similar products?
<b>Materials</b>	What is it made from? Why?
<b>Manufacture</b>	How might it be made? Why? What scale of production? Why?

Technique	Description/ notes	Diagram
<b>Orthographic Projection/ Working Drawings</b>	<ul style="list-style-type: none"> <li>• Includes "Front", "Plan" and "End" 2D Views, and often an Isometric 3D View</li> <li>• Standardised method for scale, dimensions and line types</li> <li>• Great for manufacturing</li> </ul>	
<b>Isometric</b>	<ul style="list-style-type: none"> <li>• Common 3D sketching method</li> <li>• Can be drawn free-hand or using isometric paper and ruler</li> <li>• Angles are at 30 degrees</li> <li>• Great for seeing most of the products</li> </ul>	
<b>1-Point Perspective</b>	<ul style="list-style-type: none"> <li>• A 3D drawing method</li> <li>• Often used by interior designers and architects</li> <li>• Gives drawings depth</li> <li>• Only uses 1 vanishing point</li> </ul>	
<b>2-Point Perspective</b>	<ul style="list-style-type: none"> <li>• Used for 3D designs</li> <li>• Exaggerates the 3D effect</li> <li>• Objects can be drawn above or below the horizon line but must go to the 2 vanishing points</li> </ul>	
<b>Annotated Drawings/ Free and Sketches</b>	<ul style="list-style-type: none"> <li>• Quick and easy way of getting ideas down</li> <li>• Range of ideas can be seen</li> <li>• Annotation helps explain designs further</li> </ul>	
<b>Exploded View</b>	<ul style="list-style-type: none"> <li>• Helps see a final design of a product and all its parts</li> <li>• Can see where all the parts fit</li> <li>• Great for manufacturers</li> </ul>	

### Modelling and Development

Modelling and development are key to testing and improving products  
This can be done physically using materials like; card, foam, clay, man-made boards or virtually in **CAD**  
Modelling helps the designer get feedback from the customer, check aesthetics, function, sizes and even materials and production methods and change them if needed

### Natural Timbers

Softwoods are generally cheaper than hardwoods as they are more available, since they grow quicker.

But because man-made boards are manufactured they are cheaper than timbers. Man-made boards also come in a better variety of sizes since they don't depend on tree growth.

**Stock forms** for both include; sheets, dowel, planks, etc

<b>Hardwoods</b> come from <b>Deciduous Trees</b> . These trees lose leaves in winter and grow fruit and flowers in spring		
Material	Key info	Examples
<b>Ash</b>	Flexible, tough and shock resistant	Sports equipment Tool Handles
<b>Beech</b>	Fine finish, tough and durable	Toys, furniture and veneers
<b>Mahogany</b>	Easily worked, durable, high quality finish	High-end furniture
<b>Balsa</b>	Very soft and spongy. Light	Modelling
<b>Oak</b>	Tough, durable and hard	Flooring, furniture and veneers

<b>Softwoods</b> come from <b>Coniferous Trees</b> . These have thin, needle-like leaves and grow all year round. Often have pine cones and sometimes nuts and seeds		
Material	Key info	Examples
<b>Larch</b>	Durable, tough, good water resistance and finishes well	Furniture, flooring and used outdoors
<b>Pine</b>	Light, easy to work with but can split	Cheap furniture, construction and decking
<b>Spruce</b>	Easy to work with, high stiffness but can decay quickly	Furniture, musical instruments and construction

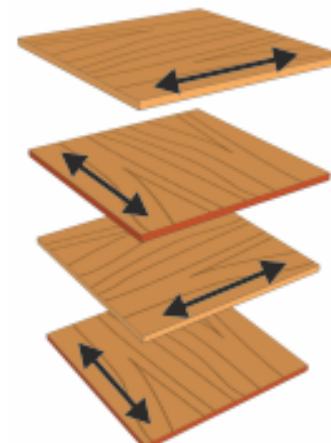

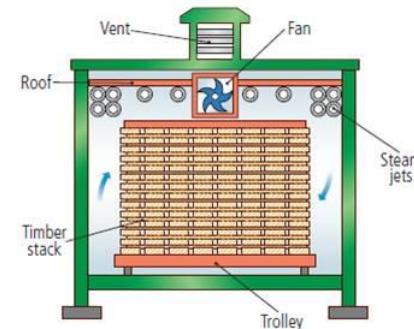

### Man-Made Boards

<b>Manufactured boards</b> are made from wood chips/dust/ layers and glue.		
Material	Key info	Examples
<b>Chipboard</b>	Prone to chipping but good compressive strength. Not-water resistant	Flooring, low-end furniture, flat-pack
<b>MDF</b>	Rigid and stable. Easy to finish. Absorbs liquid easily	Flat-pack furniture and kitchen units
<b>Plywood</b>	Very stable. Exterior veneer can be used from more expensive woods	Shelving, furniture, toys

### Primary Processing of Papers and Boards

Trees are cut then converted into planks by cut using saws  
It is then seasoned to reduce the moisture in the wood. This is done by either:

- Air-drying** – Planks are stacked and air allowed to circulate; causing evaporation
- Kiln-drying** – Where planks are put into a kiln and dried rapidly. This process is more costly than air-drying

Manufactured boards can be either be made by lamination or compression

**Lamination** – Layers of woods and adhesive are layered and compressed together. Usually with a more expensive wooden veneer on the top

**Compression** – Wood is shredded, heated and compressed with adhesive under extreme pressure
